Semaphores issue

#apachectl -S -> First check apache config and figure out logs
#check the logs and see whats the issue. It's good habit that always first looks for the error log.
#ipcs -s
Make sure httpd is stopped. Dont stop root user semaphores value. Only look for apache
#ipcs -s | awk -v user=apache '$3==user {system("ipcrm -s "$2)}'
ipcs -s -> Check apache related semaphores cleared.

1:38

double check before executing the commands
we are not going to execute same commands for all type of issues
